### Senior Cloud Engineer — Publix

- Built a Microsoft Teams SPFx portal used by all cloud application teams to identify firewall blockers by system ID and submit Azure DevOps remediation tickets to the cloud networking team.
- Designed an Azure Function-based onboarding service that generates environment-specific Terraform, creates Azure DevOps pipelines, and opens pull requests automatically for new application environments, reducing onboarding time from one week to about one hour and removing manual Terraform coding from the process.
- Built a FastAPI-based Azure Function App that hosts APIs for multiple internal projects, including firewall port evaluation, Log Analytics queries, Azure Resource Graph lookups, and Azure Data Explorer integrations.
- Automated firewall and DNS change workflows in Azure DevOps using service hooks that push requests to a storage queue, where an Azure Function App validates and cleans ticket data before generating Terraform pull requests, removing manual coding and leaving engineers to review and implement the PR.
- Built scheduled Azure Functions that review 200+ onboarding pipelines every Tuesday and Thursday, automatically re-running stale pipelines and opening follow-up work items when runs do not complete successfully.
- Deployed Palo Alto firewalls in Azure using Terraform and supported cross-cloud controls for secured GCP-to-Azure traffic, including Panorama-based policy management.

Azure | Terraform | Azure Functions | Azure DevOps | Azure Storage Queues | SPFx | FastAPI | Palo Alto Firewalls | Palo Alto Panorama | Python | Git
